MADFU · MERCHANT ONBOARDING

Unified Onboarding Master Flow Board

Every screen, decision, branch, retry and outcome of the implemented onboarding — left to right. Screens are the live prototype components; journeys are derived by running the real journey engine. Synthetic data only.

24 screen nodes · **18** distinct screens · **20** decisions · **101** connections · **29** journeys

LEGEND

- ☐ User-facing screen (live wireframe)
- ▢ External integration (paid / simulated)
- ⬚ Future scope
- - - - Retry loop
- ◇ Business decision
- ⬚ Manual review / flag
- ⬭ Connector (jump)
- ┈ Permitted step back
- ▢ Backend operation
- ☐ Final outcome
- — Transition

How to read: start at **S01** (new applicant) or **S00** (returning). The flow splits after the category decision into Path A (Registered Business) and Path B (Freelancer). Applications leaving self-onboarding drop into the manual-review lane; every route ends in an outcome.

ASSUMPTIONS & OPEN DECISIONS — not confirmed business rules

D-01 SAR 100,000 boundary — Configurable in rules/config.ts (REVENUE_BANDS, REVENUE_ROUTING).
D-04 OTP resend & expiry — Expiry 120 s, cooldown 30 s, 3 resends, resend does not reset attempts; lockout requires a new application.
D-07 Existing freelancer — add certificate — Documented branch from S01-X to S01-F placeholder marked FUTURE FLOW. No implementation.
D-10 IBAN technical errors — 3 technical errors → status "pending (provider)", separate flag; contract allowed subject to processing rules.
D-13 "Pending manual review" category — Stops and saves a review lead (Outcome C) before any paid call. Configurable: STOP_AS_LEAD | CONTINUE_WITH_FLAG.
D-16 Certificate not found after Nafath — Flag CERT_NOT_FOUND_MANUAL_ENTRY (blocking).
D-19 Nafath presentation — Dedicated screen with a very large circular number.
D-22 IBAN ownership provider — Typed adapter returns verified / not_verified / technical_error.

D-02 Contract signing technology — Generic checkbox + "Accept and submit" placeholder; acceptance simulated and not legally binding.
D-05 Category restriction catalogue — Clearly labelled fixture catalogue in rules/categories.ts.
D-08 API failures after retries — 2 silent auto-retries, then 3 manual retries, then "save and exit"; resuming grants a fresh retry allowance.
D-11 Nafath technical failure — NAFATH_POLICY.technicalFailureConsumesAttempt = false (configurable).
D-14 Identity lock — Fields read-only; a new application is required. Abuse via restarting needs a server-side control.
D-17 Lead resubmission — Demo registry in browser storage (clearable from Prototype Controls).
D-20 Nafath status delivery — Waiting state persists across refresh; resolution simulated by timer or dev simulator.
D-23 VAT number rule — 15 digits starting and ending with 3 (structural placeholder).

D-03 Government validation patterns — Structural regex placeholders (10 digits) kept separate from simulated government verification.
D-06 Certificate / category reconciliation — Fixture mapping table; mismatches flagged (journey continues); expired / inconsistent certificates flagged and contract disabled (manual review).
D-09 Contract decline handling — Application saved, not submitted, status CONTRACT_PENDING with CONTRACT_DECLINED flag; applicant can review again.
D-12 IBAN check for CR without Nafath — Not called (cost avoidance; application goes to manual review). Configurable per applicant type.
D-15 Resume authentication — Browser-storage resume without re-authentication (demo only).
D-18 Category picker — Real catalogue size may require a searchable / grouped picker instead of two dropdowns.
D-21 Related-party data — Separate mock call; entity type field drives the individuals-only filter.

Shared entry & eligibility

Both applicant types · entry → duplicate checks → OTP → revenue → category

Path A — Registered Business (CR)

CR verification → authorized person → Nafath → details → contract

Path B — Freelancer

Nafath on National ID → certificates → details → contract

Manual review & sales leads

Applications leaving self-onboarding

Final outcomes
